## Abstract

## Background

1. Colombia with 1941 known recorded bird species is one of the most species rich countries in the world. Efforts are necessary to conserve, study and promote sustainable use of this important taxonomic group throughout Colombia's vast territory.
2. In an ideal world, informed decisions that are based on sound scientific information should be likelier to have successful outcomes. Nevertheless, there are barriers that make it difficult to access and use information in a timely fashion. Those same barriers impede the study, conservation and sustainable use of bird species in Colombia. On the other hand, given that there is good documentation about the ecology of a large number of species, information about the distribution of birds can be easily incorporated into decision-making processes, once this information becomes readily available in a consumable format using Geographic Information Sciences tools.
3. In this context, the main objective of this paper is to present the first compilation of the current distribution of 1889 (97%) species of birds in Colombia, using expert criteria. The

shapefiles were used to show the distribution and diversity of bird species in Colombia under both geopolitical and conservation geographic units.

4. The information provided in this paper can be used as a baseline for a huge number of initiatives that aim to strengthen conservation efforts and improve knowledge about one the most unique taxonomic groups in the country. These range from land use planning strategies at the municipal or department scale to sustainable use of bird species - such as those initiatives related to bird watching - in Colombia.

## New information

This study has considered three key aspects: 1) the importance of birds for Colombia's ecosystems, 2) the privileged place of Colombia in bird species richness and 3) the importance of data mobilisation in formats easily consumable by Geographic Information Systems (GIS) to facilitate the processes of informed decision-making. We present the first compilation - in shapefile format - for 1889 of the 1941 bird species recorded from Colombia. Using this novel collection, we showed the species richness of birds in Colombia's 33 Departments plus its Capital District (DPs), 1122 Municipalities (MNs), 58 protected areas (PAs), 39 Regional Autonomous Corporations (the authorities responsible within their respective jurisdictions for regulating the environment and renewable natural resources in Colombia; CARs) and 916 Collectively Titled Territories (including both indigenous reservations and afro-descendant communities; CTTs). In addition, we provide a list of known bird species richness for the above geographic units found in the available literature. The information provided here can be used as a baseline for a huge number of initiatives concerning the study, conservation and sustainable use of bird species present in Colombia, providing access to key features of bird distribution that should facilitate decision-making.

## Keywords

Aves, biodiversity, conservation, data mobilisation, decision-making, GIS, sustainable use

## Introduction

Birds inhabit almost every ecosystem on earth and are amongst the most diverse, active and important ecosystem service providing groups (Sekercioglu 2006). Given the large body of knowledge about birds, they are frequently used in initiatives related to conservation and sustainable use of biodiversity around the world (Hausmann et al. 2019). Colombia, with 1941 known bird species (Ayerbe-Quiñones 2019), is amongst the countries with the highest species richness of this biological group worldwide. Given the above, special effort is required to make information about Colombian birds freely available for research, conservation and sustainable use management and planning.

In an ideal world, decisions that are informed by sound data should have better odds of producing successful outcomes. Actions related to the study, protection and sustainable use of birds must be supported by information about the species and their relationships with both biotic and abiotic components of ecosystems. Activities that require data on bird distributions include: national planning and budgets for resource management in sectors such as agriculture, mining, infrastructure, protected areas, compliance with multilateral environmental agreements; development of environmental resource legislation; measurement and mitigation of human impact on the environment; mitigation of anthropogenic drivers and conflicts; and projects on sustainable use of biodiversity (Stephenson et al. 2017). Nevertheless, there are barriers that make it difficult for consumers to access and use information in a timely fashion.

Stephenson et al. (2017) pointed out several barriers that make it difficult to access and use information for biodiversity management. The four groups of barriers identified in the aforementioned paper are: 1) data availability, 2) data quality and usability, 3) willingness to collect and use data and 4) technical and financial capacity. However, with both constant technological advances and increasing necessity for information, an important ecosystem of tools, institutions and initiatives has grown with the aim of increasing technical capacity in biodiversity data mobilisation, use and reuse. Nevertheless, there are key issues remaining to be addressed that concern both data and domain integration of biodiversity information (König et al. 2019).

Data and information are valued in the degree in which they are findable, usable and in formats consumable by Geographic Information Sciences (GIScience), relevant to decision-making processes. Foody (2008) concluded that GIScience provides both data on environmental properties and techniques to explore, visualise, use and integrate geographic information with other data (e.g. biological data) for understanding biodiversity and conservation. For these reasons, we were inspired to create an invaluable information resource that would be useful as baseline to understand and conserve bird species based on their geographic distribution in Colombia.

## General description

**Purpose:** Given the importance of data mobilisation for democratising information about birds in Colombia, the main objective of this paper is to present a shapefile with the current distribution of 1890 species of birds recorded from Colombia and use the obtained distribution to show some key features of bird species richness in Colombia in both geopolitical and conservation geographic units to facilitate decision-making processes, scientific research and sustainable use of biodiversity in Colombia.

## Sampling methods

**Step description:** We used 1889 expert-based bird distribution maps obtained from the Guide to Birds of Colombia (Ayerbe-Quiñones 2018). The bird distribution maps in PNG

format were georeferenced and transformed into a raster format and posteriorly into a vector shapefile format using the Python Programming Language 2.7 and the software ArcGIS 10.7. Once we had the individual bird species maps in shapefile format, we used this information to obtain some key features and figures on bird species richness in Colombia. To perform this task, we evaluated distributions in three key management units in the country: geopolitical units, management and conservation units and collective territories.

To obtain the bird species number per geopolitical, natural, management and collectively titled territories, we made layer intersections between the shapefile of bird distribution and the layers for each one of the selected territories, using the EPSG 4686 system in the software ArcGIS v. 10.7 software. Layers used for intersection were: DPs and MNs (IGAC 2019), PAs (PNNC 2019), CARs (IDEAM 2018) and CTTs (Etnoterritorios 2020a, Etnoterritorios 2020b). Metadata for each one of the layers can be consulted in the respective data resource.

Finally, to make the compilation freely available, we uploaded it into the online data repository of the Instituto de Investigación de Recursos Biológicos Alexander von Humboldt (<http://geonetwork.humboldt.org.co/geonetwork/srv/spa/catalog.search#/home/>). In addition, the distribution map of each species was uploaded into the BioModelos platform where it can be consulted by species name (<http://biomodelos.humboldt.org.co/>).

## Geographic coverage

**Description:** To establish the geographic coverage, we used the EPSG 4686 coordinates system. All the Colombian territory is included in this work.

**Coordinates:** -4.204 and 13.390 Latitude; -81.763 and -66.829 Longitude.

## Taxonomic coverage

**Description:** In this paper, we follow the taxonomic system of Ayerbe-Quiñones (2019).

**Taxa included:**

Rank	Scientific Name	Common Name
class	Aves	Birds

## Usage licence

**Usage licence:** Other

**IP rights notes:** [Creative Commons Attribution \(CC-BY\) 4.0 License.](https://creativecommons.org/licenses/by/4.0/)

## Data resources

**Data package title:** Distribution of birds in Colombia. Year 2020

**Resource link:** <http://geonetwork.humboldt.org.co/geonetwork/srv/spa/catalog.search#/metadata/5c2b19d2-6893-4955-aa65-509d1c3f2706>

**Number of data sets:** 2

**Data set name:** BIRD\_Colombia

**Download URL:** [http://geonetwork.humboldt.org.co/geonetwork/srv/api/records/5c2b19d2-6893-4955-aa65-509d1c3f2706/attachments/BIRD\\_Colombia.rar](http://geonetwork.humboldt.org.co/geonetwork/srv/api/records/5c2b19d2-6893-4955-aa65-509d1c3f2706/attachments/BIRD_Colombia.rar)

**Data format:** Shapefile

**Description:** The .Zip file contains a shapefile with the distribution of bird species in Colombia. The shapefile has three attributes.

Column label	Column description
Order	Scientific name of the Order in which the species is classified
Family	Scientific name of the Family in which the species is classified
Species	Bird species

**Data set name:** Additional data

**Download URL:** [http://geonetwork.humboldt.org.co/geonetwork/srv/api/records/5c2b19d2-6893-4955-aa65-509d1c3f2706/attachments/BIRD\\_Colombia.rar](http://geonetwork.humboldt.org.co/geonetwork/srv/api/records/5c2b19d2-6893-4955-aa65-509d1c3f2706/attachments/BIRD_Colombia.rar)

**Data format:** EXCEL file

**Data format version:** .xlsx

**Description:** Within the same .Zip that contains the BIRD\_Colombia shapefile, there is an Excel file with three sheets where the number of bird species per Municipalities, Indigenous Reservations and afro-descendant communities is shown. The Excel file has seven attributes.

Column label	Column description
Code_Dane	MN unique identifier assigned by the Colombian "Departamento Administrativo Nacional de Estadística" (DANE)
Department	Name of the Department
Municipality	Name of the Municipality
Spp	Number of species

Indigenous reservation name	Name of the reservation
Etnia	Name of indigenous ethnicity
Afro-descendant community	Name of the community

## Additional information

As pointed out by Chapman (2005) - referring to primary species-occurrence data - biodiversity information has endless uses in almost every aspect of human endeavour worldwide. These include aspects that are not so obvious, such as food security, education and recreation. The same author called attention to the fact that it is necessary to make maximum use of these data to better understand biodiversity, to mitigate and monitor changes to our environment and to improve, conserve and sustainably use our biodiversity. In this context, the Shapefile compilation presented here has the potential to facilitate and improve research, conservation and sustainable use of biodiversity in Colombia, with a special focus on the country's charismatic and ecologically-important birdlife.

Expert-based range maps for species distribution - like those presented here - are useful tools that help in research and conservation of biodiversity. With some limitations, these kinds of distributional models, based on group expert criteria, become valuable in cases in which there is a lack of reliable information on the distribution of biological species (e.g. Fourcade 2016, Mainali et al. 2020) and as a complement to both species distribution and ecological niche modelling techniques (e.g. Fourcade et al. 2013, Merow et al. 2017). Such maps can help to establish an information baseline to understand biodiversity patterns in poorly-known species. We consider that the lack of information for several species of birds in Colombia can be remedied in the meantime by the models presented here, which can be used as a starting point for many research, conservation and decision-making processes. A dynamic process for improving information on species distributions in one the most biodiverse countries of the world will make it possible to generate a Living Atlas of Colombian Biodiversity that can be improved over time with the help of experts and the inclusion citizen science data.

Key figures on bird species richness in Colombia per different geographic units are presented in Tables 1, 2, 3, 4, 5. Information provided in these Tables can be used for a quick comparison between the number of species in different geographic units. Here, we present diverse examples of the information and comparisons that can be made in different territories. Additionally, we provide a comparison to available information - including both eBird (2020) database and literature - of the number of species recorded per DPs and PAs (Tables 1, 4). The differences amongst the number of species presented by sources are due to differences in the methods and sampling effort used to obtain the information. Expert maps use a coarser resolution than other methods; this can explain the tendency to obtain the highest number of species per geographic unit with this method. As noted

above, expert maps are used as a baseline and complement knowledge that can be used for education, decision-making processes and research.

## Acknowledgements

We are grateful to the Humboldt Institute for providing funding to make this publication possible. We thank the BioModelos team for uploading the species models in the BioModelos platform. We thank Laura Jaramillo Mejia for her work on the database of the Avifauna Colombiana project. We also thanks Lauren Raz and Christopher K. Starr for reviewing the early version of this paper. The Coordenação de Aperfeiçoamento de Pessoal de Nível Superior (CAPES) provided financial support to DV.

## Author contributions

DV conceived the idea, work coordination and wrote the manuscript; ET, JT and BR developed the shapefile compilation, GIS processing and wrote the manuscript; CC-M wrote the manuscript; JR eBird consultation and wrote the manuscript; FA-Q provided original species distribution models in digital format, taxonomic review and provided critical elements to develop the manuscript and shapefile compilation; JMO-Q provided critical elements to develop the manuscript and shapefile compilation and he critically reviewed the final manuscript.
