Abstract

Background

The Cerambycidae are one of the largest beetle families. Cerambycid beetles are found on all continents, but the tropics are extremely rich in this species. The genus *Criodion* (Audinet-Serville, 1833) includes 13 species in the Neotropical Region, two of which occur in Central America. Panama has a high biodiversity, yet a small number of sites have been extensively studied. In this contribution, new distributional data are given for *C. cinereum* (Olivier, 1795) and *C. tuberculatum* Gahan, 1892.

New information

Two species of the genus *Criodion* (Audinet-Serville, 1833) are recorded for first time in Panama, *Criodion cinereum* (Olivier, 1795) and *Criodion tuberculatum* Gahan, 1892. Relevant details are presented for each species.

Keywords

Sphallotrichina, *Criodion*, *cinereum*, *tuberculatum*

Introduction

The Cerambycidae, commonly known as Longhorn beetles, comprise one of the largest and most varied families of the Coleoptera, and though they have been studied for a century, descriptions of new species and new distributional records have accelerated in recent decades (Bezark 2014, Monné 2015). The genus *Criodion* (Audinet-Serville, 1833) currently includes 13 described neotropical species that range from Guatemala to Argentina, eleven of which are distributed in South America, where some are endemics and others are widespread (Martins 2004). We report two new records for the Panamanian fauna: *Criodion cinereum* (Olivier, 1795) and *Criodion tuberculatum* Gahan, 1892.

Materials and methods

Photographs were taken with a Nikon D7000 camera, Nikon-DX- 18-55mm macro lens. Specimens were studied using a Leica MZ6 stereomicroscope, and their identification was carried out with the aid of the reference collection at the MIUP, and the identification keys of Martins 2004.

Acronyms for the collections consulted during this study are as follows:

CRUC Colección de insectos, Escuela de Biología, Universidad de Panamá
Centro Regional de Colon;

MIUP Museo de Invertebrados Graham Bell Fairchild, Universidad de Panamá.

Distribution

This species has been recorded from Costa Rica, Colombia, Bolivia, Brazil, French Guiana, Peru, Surinam, and Venezuela (Monné 2015). The reported occurrences of *C. cinereum* in Puerto Rico and Paraguay are doubtful.

Notes

Adults of *C. cinereum* differ from the similar South American *C. torticolle* Bates, 1870 by the basal antennomere not reaching the anterior margin of the pronotum, pronotal gibbosity scarcely apparent; prosternal process not exceeding the procoxae; and middle femoral apical spines not markedly projected (Olivier 1795, Gahan 1892). According to Martins (2004), the distinctions between *C. cinereum* and *C. torticolle* have always been problematic. (Fig. 1)

(1892).Notes on longicorn Coleoptera of the group Cerambycinae, with descriptions of new genera and species. The Annals and Magazine of Natural History 6 (9): 19-32; institutionID: Museo de Invertebrados, Universidad de Panama; institutionCode: MIUP; collectionCode: Insects; ownerInstitutionCode: UP; basisOfRecord: Preservedspecimen

Distribution

Previously, *C. tuberculatum* had been recorded only in French Guiana, Brazil, and Peru (Gahan 1892, Monné 2015)

Notes

This species resembles *C. rhinoceros* Bates 1870 by the presence of two apical spines on each elytron, a character that separates these species from other species of *Criodion*. Characteristics such as *C. rhinoceros* having strong but unarmed mandibles, and the color of the body pilosity are very helpful in distinguishing the two species, being yellowish in *C. tuberculatum* and grayish in *C. rhinoceros*. (Fig. 2)

Figure 2.

Discussion

The biology and ecology of *Criodion* species are little known. According to Bondar (1921), Lorenzi (1992) and Martins (2004) *Criodion* larvae feed on plants belonging to the family Fabaceae. They eat live tissues of these plants and make two kinds of galleries; 1) twisted, with openings at several places along the trunk or at the base of the trunk and 2) straight, with exits at the basal end of the galleries. Some of their host plant genera are present in Panama, e.g., *Inga* (Guaba), *Acacia* (Cachito), and *Bauhinia* (Pezuña de Vaca) (Correa et al. 2004, Condit et al. 2013), but the host plants of *C. cinereum* and *C. tuberculatum* in Panama are unknown. Fiorentino and Bellomo (1997) report that some species of *Criodion* are parasitized by chalcid wasps (*Eumegalocus* sp., *Parastypiura* sp.), encyrtid wasps (*Dioencyrtus fiorentinoi*, *Amauroencyrtus micans*), and tachinid flies, however, the parasitoids of *C. cinereum* and *C. tuberculatum* in Panama are unknown.

Acknowledgements

We thank the Darien fund for their financial support for our field trips to Parque Nacional Darien; Museo de Invertebrados G.B. Fairchild staff for their support, and Eugenio Nearn, Purdue Entomological Research Collection, Purdue University, for his useful comments, and Maricarmen Lanuza-Garay and Annette Aiello (STRI) for their help in reviewing this manuscript.
