Abstract

Background

This paper complements the data published thus far about species of the nymphalid family with data collected in Romania's eight regions between 1887 and 1984 and elsewhere in Europe (Austria, Germany, Croația, the Republic of Moldova, Serbia and Switzerland), including the date and the site of original collection. For the first time, this research presents the collecting information of the species held in the entomological collection of the Museum of Natural History in Sibiu. It identifies the species of the nymphalid family in six of the museum's lepidoptera collections. These collections are of extraordinary interest not least because they are associated with natural scientists of European renown, such as Daniel Czekelius, Eugen Worell, Viktor Weindel, Rolf Weirauch, Heinrich Hann von Hannenheim and Eckbert Schneider. The analysis, cataloguing, centralisation and updating of the nomenclature resulted in a number of 1,865 specimens from 49 species

and fifteen genera (of the 90 referenced in Romania's fauna): *Aglais*, *Apatura*, *Araschnia*, *Argynnис*, *Brenthis*, *Boloria*, *Euphydryas*, *Inachis*, *Issoria*, *Libythea*, *Limenitis*, *Melitaea*, *Neptis*, *Nymphalis* and *Polygonia*. Data published in a previous article add 101 specimens from the *Vanessa* genus.

New information

Most species originate regionally from the nine counties of Transylvania followed by Oltenia and Moldova (three counties each), Banat and Dobrogea (two counties each), Crișana, Satu Mare and Muntenia (one county each) and the capital of Romania, Bucharest. The species presented in this paper also include the extinct taxon *Polygonia egea* (Cramer, 1775), Eugen Worrell collection and three species that are endemic to Romania: *Melitaea retyezatica* Diöszeghy, 1930, *Argynnис pandora dacica* Hormuzaki, 1892, Daniel Czekelius collection and *Boloria pales* ([Denis & Schiffermüller], 1775) *carpathomeridionalis* Crosson et Popescu-Gorj, 1963, both in the Viktor Weindel collection.

Introduction

Tracing the historical evolution of butterflies from the nymphalid family requires updating the information on the species' long-term collection. Updating this information allows ascertaining in how far environmental and anthropogenic factors (Fox et al. 2019, Choi et al. 2021) have determined the temporal and spatial abundance and dominance of these species (Ştefanescu et al. 2021). In Romania, as in other European countries, the entomological material held at natural history museums is a valuable resource for researching declining or extinct populations of butterflies. In museums in Romania, data on butterfly species belonging to the nymphalid family have been collected over time from the whole country and the world and have been obtained through exchanges between specialists or from collectors. The data pertaining to specimens of the nymphalid family thus offer information about the collection sites (Popescu-Gorj 1960, Popescu-Gorj 1964, Popescu-Gorj and Drăhia 1964, Ciocchia and Barbu 1980, Capușe and Kovács 1987, Burnaz 2002, Marcu and Rákosi 2002, Stănescu 2005, Chimișliu 2006, Chimișliu 2010, Chimișliu 2011, Chimișliu 2012). Since the 19th century, fauna research in Transylvania has been indebted to the work of numerous professional and amateur entomologists with great love for nature. The following natural scientists founded the collections studied in this paper and analysed and determined the preserved material, thus bringing an important contribution to lepidopterological research: Daniel Czekelius (1856-1938, Sibiu); Arnold Müller (1884-1937, Sibiu); Eugen Worell (1884-1961, Sibiu), Viktor Weindel (1887-1966, Sibiu); Heinrich Hann von Hannenheim (1895-1971, Sibiu), Rolf Weirauch (1906-1984, Sibiu), Alexei Alexinschi (1899-1966, Iași); Hans Rebel (1861-1940, Vienna); László

Diószeghy (1877-1942, Arad); Aurelian Popescu-Gorj (1914-1997, Bucureşti) and Eckbert Schneider (1927) (Székely 2008). The Natural History Museum opened to the public in 1895. Owing to its priceless holdings, the Museum can be currently considered as an archive of lepidoptera biodiversity in Transylvania. It, therefore, plays a significant role in Romanian and European entomological research.

The Museum was founded by German-speaking Transylvanian-Saxon entomologists who collected material in the city of Sibiu, its surroundings, neighbouring regions and other Transylvanian locations (Czekelius 1897, Czekelius 1898, Worell 1951, Székely 1996, Székely 2003, Székely 2004), as well as in other geographical regions of Romania. Throughout time, several generations of natural scientists have evaluated and continue to evaluate the data held in these collections (Caradja 1931, Niculescu 1965, Schneider 1984, Chimisiu 1989, Schneider 1996, Rákosy et al. 2003, Moise 2011a, Moise 2011b, Moise 2011c, Rákosy 2013, Rakosy and Goia 2021). The Lepidoptera collections are of central importance to the Natural History Museum's patrimony. To date, partial collecting data of the species have been published for the Daniel Czekelius, Eugen Worell, Viktor Weindel, Rolf Weirauch, Heinrich Hann von Hennenheim and Eckbert Schneider collections (Czekelius 1898, Rákosy et al. 2003, Török and Cuzepan 2014, Stancă-Moise 2017, Stancă-Moise 2018, Stancă-Moise 2019, Stancă-Moise 2020, Stancă-Moise 2021, Stancă-Moise 2022). The current paper evaluates unpublished data of specimens from the nymphalid family in order to assess this family's historical distribution in Romanian and European fauna.

Materials and methods

The material evaluated in this paper consists of specimens collected in Romania's eight regions between 1887 and 1984. The analysis has also identified specimens collected in Austria, Germany, Croatia, Switzerland, the Republic of Moldova and Serbia. The species' nomenclature was reviewed by using the actual identification keys as following (Rákosy et al. 2003, Székely 2008, Rákosy 2013, Rákosy et al. 2021) in conformity with the Fauna Europaea taxonomic system (Lampert 1923, Karsholt and Razowski 1996, Van Swaay and Warren 1999, Rakosy and Goia 2021). Each species is listed, indicating the examined material, collecting data (in the chronological order of years, months and days), number of specimens, collection sites (including the Romanian county and region), the conservation status (Rákosy et al. 2021) and name of the collector. Question marks are used in cases where information is missing, incomplete or the writing could not be deciphered. All data originate from museum labels; Romanian place names originally listed in German have been replaced with contemporary Romanian ones.

Abbreviations:

Collectors: Daniel Czekelius (DC), Eugen Worell (EW), Viktor Weindel (VW), Rolf Weirauch (RW), Heinrich Hann von Hennenheim (HH), Eckbert Schneider (ES).

Romanian regions: Banat (BT), Crișana (CR), Oltenia (OT), Muntenia (MT), Moldova (MD), Dobrogea (DB), Satu Mare (SM), Transilvania (TR)

Romania's counties: Arad (AR), Alba (AB), Bistrița-Năsăud (BN), Brașov (BV), Caraș-Severin (CS), Cluj (CJ), Constanța (CT), Covasna (Cv), Galați (GL), Gorj (GJ), Harghita (HR), Hunedoara (HD), Ilfov (IF), Maramureș (MM), Mehedinți (MH), Mureș (MS), Neamț (NT), Satu Mare (SM), Sibiu (SB), Timiș (TM), Tulcea (TL), Vâlcea (VL), Vrancea (VN), București (B).

European countries: Austria (AU), Croația (HR), Germany (GE), Republic of Moldova (RMO), Serbia (RS), Switzerland (CH).

The conservation status: Extinct (EX), Critically endangered (CR), Endangered (EN), Vulnerable (VU), Near threatened (NT), Least concern (LC), Endemic (EN).

Discussion

The analysis of the six collections of lepidoptera under scrutiny in this article focused on 1,865 specimens collected between 1887 and 1984 and identified 49 species and subspecies of the 90 mentioned in Romania's fauna (Rákosi 2013, Rakosy and Goia 2021). Earlier data regarding the *Vanessa* genus are based on 101 specimens, 52 specimens of *V. atalanta* and 49 specimens of *V. cardui* (Stancă-Moise 2022). The species' listing for each collection (Fig. 1) includes the following results: Daniel Czekelius's collection, with 271 specimens, 14 genera and 49 (Table 1), Eugen Worrell's collection, 11 genera and 41 species (Table 2), Viktor Weindel's collection, 14 genera and 40 species (Table 3), Heinrich Hann von Hannenheim's collection, 11 genera, 19 species (Table 4), Rolf Weyrauch's collection, 11 genera and 28 species (Table 5) and Eckbert Schneider's collection with 14 genera and 30 species (Table 6). The oldest specimens are *Boloria selene* ([Denis & Schiffermüller], 1775) and *Nymphalis polychloros* (Linnaeus, 1758) and were collected 135 years ago. The collectors specified on the labels are Daniel Czekelius, Béla Kiss, Arnold Müller, László Diószeghy, Friedrich Deubel, Paul Tiltscher, Miklos Tütscher, Kimakowics, Adalbert Prall, Karl Alberti, Karl Petri and Vincenz Kollar.

Table 1

Daniel Czekelius's collection of lepidoptera is the oldest with specimens collected between 1887 and 1934 in the regions SM and TR, Sibiu County and nearby locations. This collection consists of 14 genera and 49 species represented by a number of 271 specimens (Fig. 1) and is, thus, the most complex collection regarding the species' biodiversity (Table 1). This collection also includes an endemic species, *Melitaea retyezatica* Diószeghy, 1930 from *Melitaea athalia* (Rottemburg, 1775), represented by twenty-six specimens collected by László Diószeghy in the Retezat Mountains (Southern Carpathians) between 1919 and 1922. The species in this collection represent the following conservation status: 18 taxa VU- 36.74%, 18 taxa NT- 36.74%, six tax LC- 12.24%, four taxa EN-8.16%, two taxa CR-4.08% and one endemic taxon, 2.04%.

Eugen Worell's collection consists of 394 specimens of 11 genera and 42 species collected between 1888 and 1959 (Fig. 1). The species originate from Romania's five regions (BT, DB, OT, MD, MT and TR) and other European countries (Austria, Croatia, Germany, the Republic of Moldova and Switzerland). The oldest specimen is the *Nymphalis polychloros* (Linnaeus, 1758) species and was collected in 1888. The collectors listed on the labels are Eugen Worell, Daniel Czekelius, László Diószeghy and Alexei Alexinschi. Considering their conservation status, these species are grouped as following: one species EX-2.38%, *Polygonia egea* (Cramer, 1775), from the site Pula, Istria, Croația, one species CR-2.38%, three species EN-7.15%, 19 species VU-45.23%, 15 species NT-35.71% and three species LC-7.15% (Table 2).

Viktor Weindel's collection contains 385 specimens of 14 genera and 40 species of butterflies of the nymphalid family (Fig. 1). They were collected in OT and TR regions

between 1903 and 1958, from various sites in Sibiu County and the Făgăraș Mountains. The oldest specimen *Argynnis paphia* (Linnaeus, 1758) was collected in 1903. The collection also contains an endemic species, *Boloria pales* ([Denis & Schiffermüller], 1775) *carpathomeridionalis* Crosson et Popescu-Gorj, 1963 that was collected in the Făgăraș Mountains. Viktor Weindel is the collector listed on the labels. The endangerment level of the specimens is the following: two species CR-5%, three species EN-7.5%, 15 species VU-37.5%, 15 species NT-37.5% and five species LC-12.5% (Table 3).

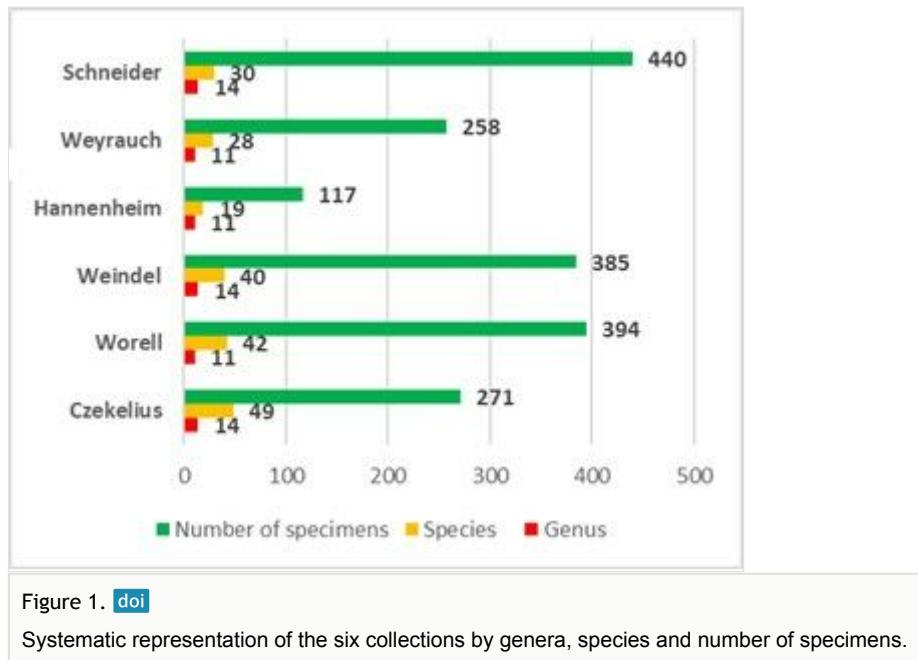

Figure 1. [doi](#)

Systematic representation of the six collections by genera, species and number of specimens.

The fewest specimens are found in Heinrich Hann von Hannenheim's collection consisting of 117 specimens distributed in 11 genera and 19 species (Fig. 1). The oldest specimen is *Brentis hecates* ([Denis & Schiffermüller], 1775) collected in 1928. The species were collected in BT, DB and TR and were determined by the collector himself whose name can be found on all labels. Conservation status is as follows: nine species VU-47.37%, six species NT-31.58% and four species LC-21.05% (Table 4).

Rolf Weihrauch's collection contains 258 specimens distributed in 11 genera and 28 species (Figure 1) collected from 1922 to 1978. The oldest specimen is *Euphydryas orientalis* (Herrich-Schaffer, [1851]) sin. *Euphydryas aurinia* (Rottemburg, 1775) collected in 1922. The information on the labels is unreadable. The species were collected in BT, DB, OT, MD, MT and TR from the Southern Carpathians, as well as in Austria. All species were determined by the collector whose name appears on all labels. The analysis of their endangerment level is as follows: three taxa CR-10.7%, two taxa EN-7.14%, 11 taxa VU-39.28%, 10 taxa NT-35.73% and two taxa LC-7.14% (Table 5).

The newest is Eckbert Schneider's collection. It contains 440 specimens of 14 genera and 30 species (Fig. 1) collected between 1949 and 1984 in BT, CR, DB, OT, MD and TR, as well as the Western Carpathians. The oldest specimen was collected in 1949 and is the only *Lybitea celsis* (Laicharting, 1782) species held by the Museum. The endangerment level of the collection's specimens is as follows: three specimens EN-10%, 10 specimens VU-33.33%, 12 specimens NT-40% and five specimens LC-16.67% (Table 6).

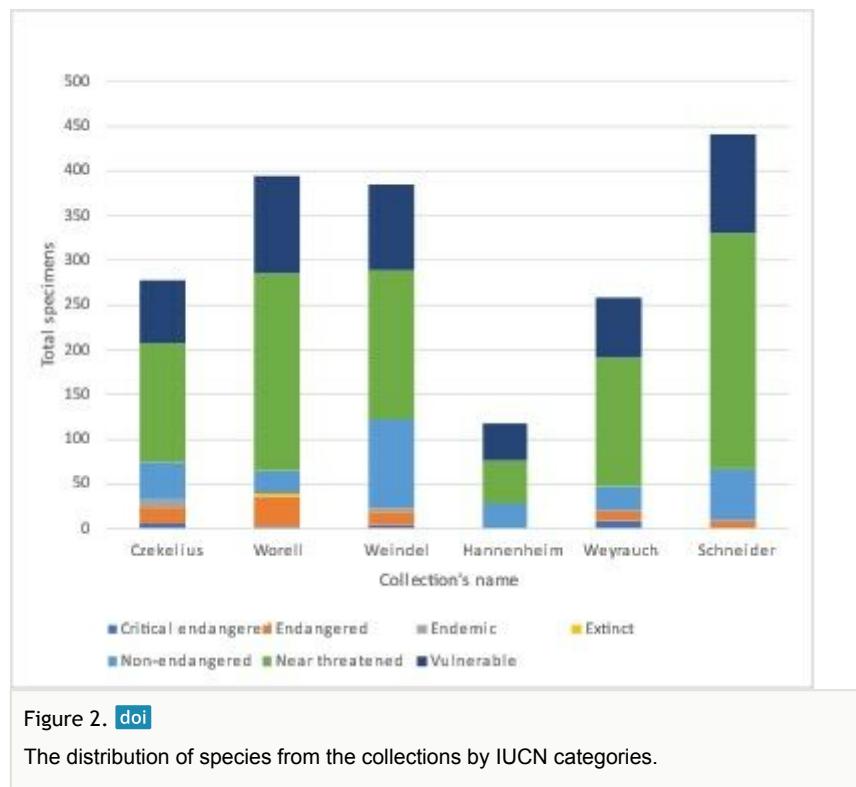

Figure 2. [doi](#)

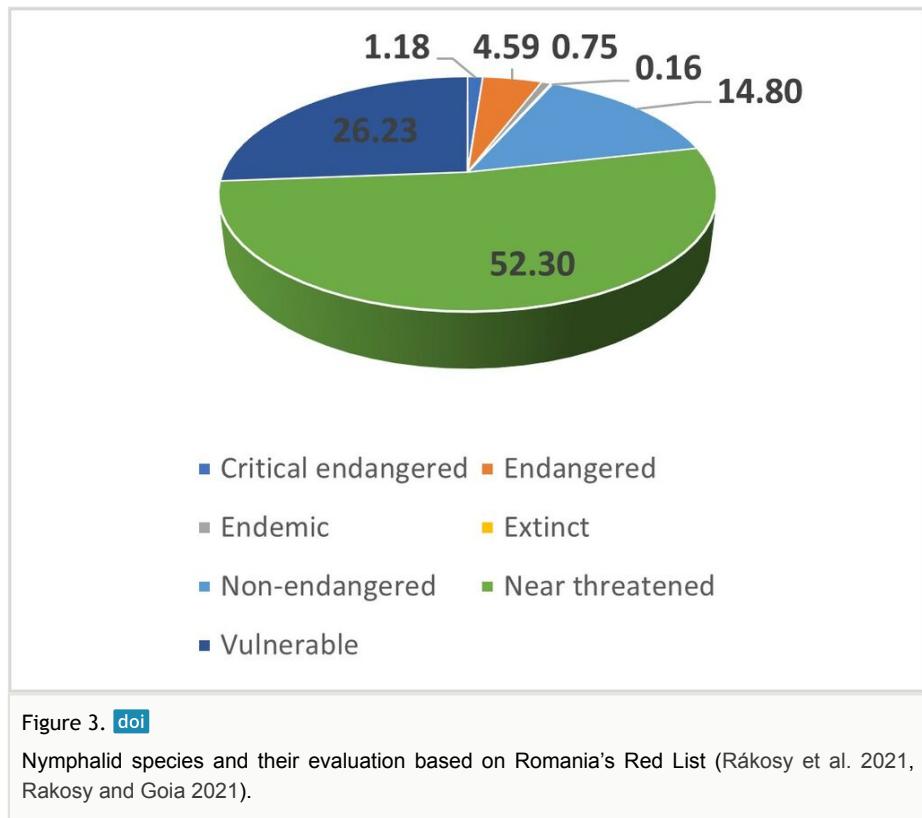

The distribution of species from the collections by IUCN categories.

We present data pertaining to genus diversity, species and existing specimen number present in each collection (Fig. 1). The oldest collection (DC) displays the highest diversity of species. This collection contains 14 genera and 49 species. It is followed in chronological order by EW with 42 species and VW with 40, confirming that, at that time, natural scientists were interested in learning more about and studying the biodiversity of butterflies in SB, the neighbouring localities, as well as in other TR sites and Romanian regions. The species from the more recent collections (HH and RW) contain a lesser number of genera and species, but include more specimens from the DB region. The newest collection (ES) re-confirms the presence of 30 butterfly species of the Nymphalid family captured in six Romanian regions (TR, BT, CR, MD, DB and OT) that are also represented by the largest number of collected specimens.

To facilitate national and international comparison, we present data referring to the distribution of species considering the IUCN conservation categories in Fig. 2 (Rákosy 2013,

Rakosy and Goia 2021), revealing that the majority of the species of all six collections are potentially endangered taxa (NT) followed by non-endangered (LC), vulnerable (VU), critically endangered (EN) extinct (EX) and endemic taxa.

We also present the percentages of the Nymphalid family's zoological categories in (Fig. 3). The highest value (52.30%) pertains to potentially endangered taxa, followed by critically endangered (26.23%), non-endangered (14.80), endangered (4.59%), vulnerable 1.18%, as well as extinct (0.16%) taxa.

By synthesising the data referring to the six lepidoptera collections (DC, EW, VW, RW, HH and ES), we identified 157 sites where the butterflies of the nymphalid family were collected between 1887 and 1984. The species were collected in all of Romania's eight regions, from 23 counties and the capital of Bucharest, i.e. on 56.1% of Romania's territory. I designed a map based on these data that reflects the distribution of species in eight regions whose counties are listed by collector: (1-DC), seven counties, BN, BV, CJ, CV, HR, MS, SB, all in the TR and SM regions, (2-EW), nine counties, BV, CS, CT, GL, GJ, IF, MS, VL, SB, from five of Romania's regions: BT, DB, OT, MD si TR; (3-VW), seven counties, AB, BN, BV, HR, NT, VL, SB, from three regions: MD, OT, and TR; (4-RW), 16 counties, BN, BV, CJ, CS, CT, CV, GL, GJ, HR, HD, IF, MH, VL, SB, TM and Bucharest, from six of Romania's regions: BT, DB, MD, MT, OT, TR and Bucharest; (5-HH), six

counties, AB, BV, CS, CJ, HR, SB, from two of Romania's regions: BT and TR; (6-ES), 16 counties, AB, AR, BN, BV, CS, CJ, CT, GJ, HD, MH, MS, VL, SB, TM, TL, VN, from six of Romania's regions: BT, CR, DB, OT, MD, TR (Fig. 4).

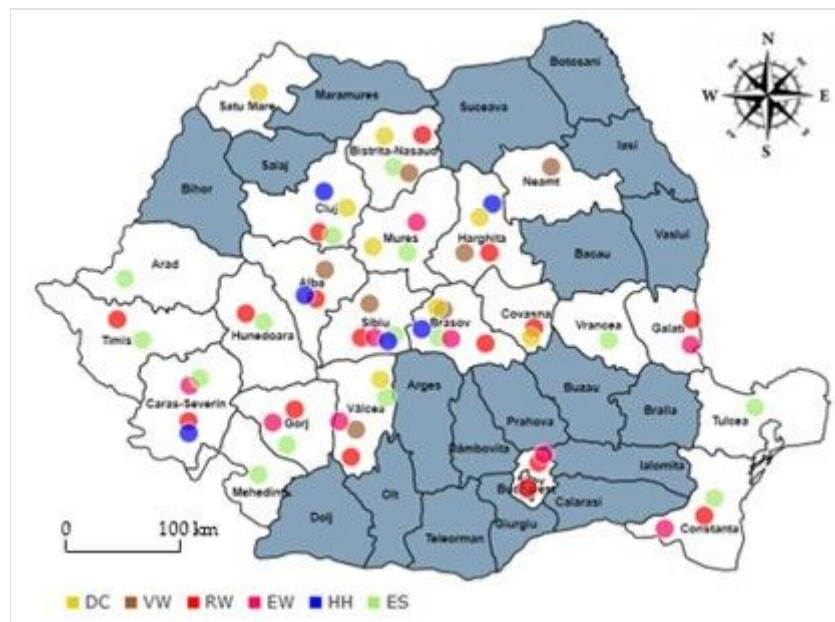

Figure 4. [doi](#)

Geographical representation of Romania and the sites of collectors (red bullet - represents RW, blue bullet - represents HH, yellow bullet - represents DC, brown bullet - represents VW, green bullet - represents ES and pink bullet - represents EW).

The species collected in other European countries (Austria, Croatia, Switzerland, Germany, the Republic of Moldova and Serbia) were also graphically represented in Fig. 5.

Conclusions

Romania's territory has a surface of 237,500 km² that comprises a variety of geographic forms, from Alpine meadows to the Danube Delta's hydrological profile. They are populated by a diverse fauna of lepidoptera containing over 200 diurnal butterfly species. Romania's South, especially the South-East and South-West (BT and DB) is the region with the highest diversity of lepidoptera in the country (Székely 2008) and, at the same time, the northern limit of the distribution of their Balkan species in Europe (Ştefănescu et al. 2013, Wildman et al. 2022). The Danube's gorge connects the Carpathian and Balkan Mountains. This geological formation has facilitated the entry of Balkan-type mountainous-subalpine elements into Romania, as far as the Retezat Mountains, for instance *Melitaea retyezatica* Diöszeghy, 1930. Given that the Carpathian Mountains do not exceed 2,500 m in height, their butterfly fauna is characterised mostly by subalpine, boreo-alpine and boreo-montane species (Székely 2008). Most endemic species have formed in the isolated, high regions of the Carpathian Mountains. They were analysed and included in

the collections as follows: *Melitaea retyezatica* Diöszeghy, 1930, *Argynnis pandora dacica* Hormuzaki, 1892 and *Boloria pales* ([Denis & Schiffermüller], 1775) *carpathomeridionalis* Crosson et Popescu-Gorj, 1963. The Romanian Catalogue of Lepidoptera records the presence of 90 species of which the Nymphalids are distributed as follows: BT (78 species), CR (60 species), TR (78 species), SM (66 species), OT (73 species), MT (77 species), MD (68 species) and DB (62 species) (Rakosy and Goia 2021). I have identified 49 species in the collections, which represent 54.44% of the species in Romania's fauna. These species are distributed by counties as follows: BT with the counties (CS and TM); CR (AR); DB (CT and TL), MD (GL, NT, and VR); MT (IF); OT (GJ, MH, and VL); SM (SM), TR (AB, BN, BV, CV, CJ, HR, HD, MS, SB) and the capital Bucharest. Based on synthesising the collection data and on previously published data on species of this family (Stancă-Moise 2022), the present article presents 16 genera and 1966 specimens of the Nymphalid family collected in Romania since 137 years ago.

Figure 5. doi

The species collected in other European countries are graphically represented.

The article illustrates the biodiversity of the nymphalid family and their historical evolution in Romania and Europe, thus bringing an important historical, scientific and biogeographic "Council Directive (1992)" contribution to the study of butterflies. With the earliest data from 1887, my research complements current research on the presence, diversity and distribution of the nymphalid family in Romania until 1984. Alongside other rare, extinct or endangered species, the presence of nymphalid species with various endangerment levels in the patrimony of the Natural History Museum Sibiu enhances the scientific value of the museum's collections and confirms their significance for ascertaining the biodiversity and distribution of the species throughout time. Future research will include digitising the

Museum's butterfly collection to facilitate the access to the collected specimens for specialists searching for historical data on the species.

Acknowledgements

I am grateful to Dr. Carmen Stănescu who accompanied me during the documentation and study of the collections in the period 1997-2022 and who helped me in deciphering the labels and obtaining these data. We thank all the reviewers for their valuable suggestions for the scientific improvement of this article.
