Abstract

The potential fish species pool of the Kubo, Tochikura, and Ichinono river systems (tributaries of the Iwai River, Kitakami River drainage), Iwate Prefecture, northern Japan, was compared with the observed ichthyofauna by using historical records and new field surveys. Based on the literature survey, the potential species pool comprised 24 species/subspecies but only 20, including 7 non-native taxa, were recorded during the fieldwork. The absence during the survey of 11 species/subspecies from the potential species pool suggested either that sampling effort was insufficient, or that accurate determination of the potential species pool was hindered by lack of biogeographic data and ecological data related to the habitat use of the species. With respect to freshwater fish conservation in the area, *Lethenteron reissneri*, *Carassius auratus buergeri*, *Pseudorasbora pumila*, *Tachysurus tokiensis*, *Oryzias latipes*, and *Cottus nozawae* are regarded as priority species, and *Cyprinus rubrofuscus*, *Pseudorasbora parva*, and *Micropterus salmoides* as targets for removal.

Keywords

Act on the Promotion of Nature Restoration, identification, nature restoration committee, potential species pool

Introduction

Biodiversity is rapidly declining at a global level due to a variety of anthropogenic pressures (Myers et al. 2000, Roberts et al. 2002, Brooks et al. 2006). Japan's biodiversity is no exception, primarily because of the country's high human population density and its status as a biodiversity hotspot with high endemism, including among freshwater fishes (Boufford et al. 2004, Brooks et al. 2006). Against this background, activities for the conservation and/or preservation of freshwater fishes have expanded in many regions of Japan. These include a number of nature restoration projects based on the Law for the Promotion of Nature Restoration, a Japanese domestic law that took effect in 2003 (Fujimoto et al. 2008, Matsuzaki et al. 2011).

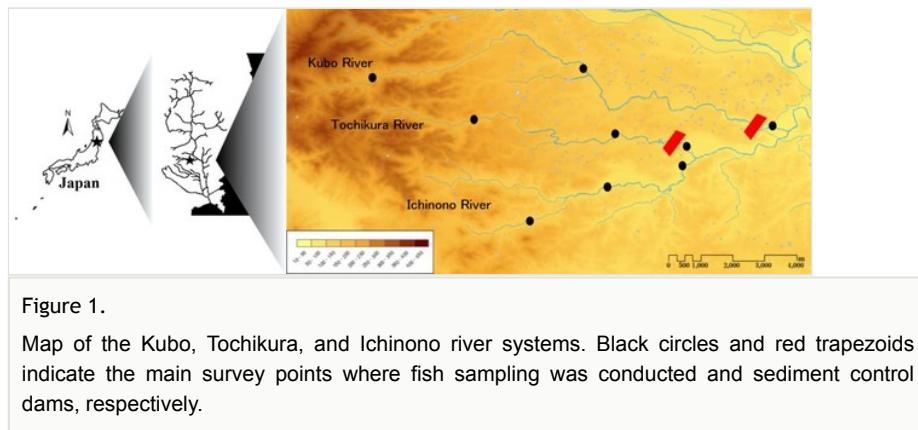

Understanding a region's biota is critical for successful nature restoration projects, particularly with respect to biodiversity conservation. When detailed survey data are lacking, determining a region's potential species pool (Lessard et al. 2012) can provide an estimate of local biodiversity status by application of the ecological filter concept (Fattorini and Halle 2004, Hobbs and Norton 2004, Funk et al. 2008). Based on this concept, species diversity at the local scale is presumed to be constrained by the regional species pool, and therefore filtered by stochastic and deterministic processes including both non-anthropogenic and/or anthropogenic factors. Such factors exert pressures on regional species diversity over longer time frames than more recent influences such as the present biodiversity crisis. An understanding of the biogeography of a region can allow us to compile a list of potential species that provides baseline data for the evaluation and design of an action plan for regional biodiversity conservation and restoration.

The nature restoration committee of the Kubo-gawa Ihatov area represents one of the projects based on the Law for the Promotion of Nature Restoration, but is unique in being overseen by private sector administration (Chisaka 2010). Part of this project has focused on the conservation and restoration of the freshwater fishes of the region, which includes most of the Kubo, Tochikura and Ichinono river systems.

In this study, we consulted historical literature to determine the potential species pool of this region (i.e., the species we predict to occur there), and carried out comprehensive field surveys to "ground truth" this list, as well as to identify fish species of conservation and restoration concern.

Materials and methods

The study region is located in the Kubo, Tochikura and Ichinono river systems ($38^{\circ}52'$ – $38^{\circ}55'$ N, $140^{\circ}56'$ – $141^{\circ}03'$ E; Fig. 1), which are all tributaries of the Iwai River within the Kitakami River drainage that empties into the Pacific Ocean (Ichinoseki City, Iwate Prefecture, northern Japan). It includes the headwaters of these rivers, and headwater areas in smaller valleys (Fig. 1). The Kubo and Tochikura rivers each have a sediment control dam constructed in the lower reaches (Fig. 1). Rural cultivation and the typical ecological networks created by rice paddy ecosystems (traditional secondary nature, “satoyama” landscape: Washitani 2008) are widely established in the region (Ohtani et al. 2013; Fig. 2a).

The potential fish species pool of the study region was determined by a review of existing literature (Kawanabe et al. 2001, Ozawa et al. 2003, Matsuzawa and Senou 2008, Kumagai and Katsushima 2012, Nakabo 2013) as follows: the freshwater fishes with a natural distributional range located entirely or partly within Iwate Prefecture were catalogued, and the subsequent list was refined by considering ecology of the individual species and geography of the study region (i.e., whether they are known to inhabit headwaters and/or upper reaches of Japanese rivers or not). In other words, the fish species included in the potential species pool were determined by literature reports recording the species from the headwaters and/or upper reaches of rivers in Japan. For example, Kawanabe et al. (2001) reported that the Japanese eel, *Anguilla japonica*, often inhabits the upper reaches of Japanese rivers including Iwate Prefecture, and therefore we included *A. japonica* in our potential species pool of the region.

The fish fauna was assessed during field surveys using hand nets, minnow traps, cast nets, set nets, and hook-and-line angling. More than 200 irrigation ponds and three sampling sites (upper, middle and lower reaches) in each of the three rivers were sampled from April to October in 2008, 2009 and 2010 (Fig. 1). The substratum of the irrigation ponds consisted mainly of silt and organic litter with aquatic plants (Fig. 2b, c). The

substratum of the river sites consisted mainly of cobble and gravel, often with boulders, as evident in the structure of one pool and riffle unit (Fig. 2d, e, f).

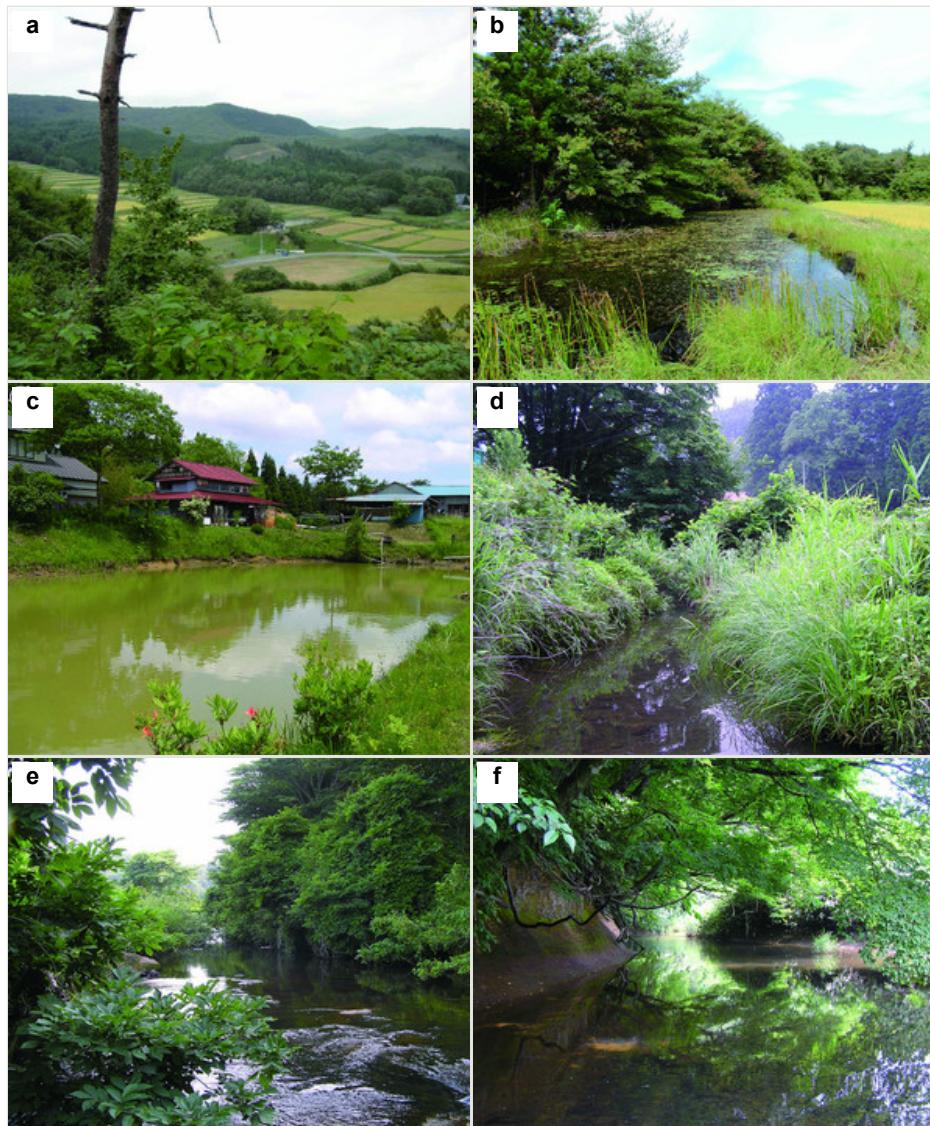

Figure 2.

Examples of the study sites.

- a: The typical landscape of the region.
- b: The irrigation pond where many aquatic plants, including several threatened species, occur.
- c: The irrigation pond that a carp population inhabits.
- d: The upper reach of the Tochikura River.
- e: The middle reach of the Kubo River.
- f: The lower reach of the Ichinono River.

Voucher specimens and photographs are deposited in the Kanagawa Prefectural Museum of Natural History, Odawara, Japan (KPM) and the National Museum of Nature and Science, Tsukuba, Japan (NSMT). Unless otherwise stated, the systematic arrangement of families and scientific names follows Eschmeyer (2014), while that of standard Japanese names follows Nakabo (2013).

To evaluate the accuracy of the potential species pool (the predicted ichthyofauna), we made rarefaction curves based on presence/absence data from our field surveys. This allows us to estimate the number of additional species that our surveys may have missed. These analyses were conducted using EstimateS with the bias-corrected formula (Chao et al. 2004, Colwell et al. 2004, Colwell et al. 2012).

Data resources

The voucher specimens and photographs are deposited and registered as KPM-NI 19440, 19447–19454, 211181–21203, 21217–21227, 21398–21413, 22248–22313, 22429–22432, 23639–23659, 23738–23745, 23933–24000, 24396–24398, 24407–24419, 24466–24476, 24988–24994, 30997–30999, 31003, 31005–31007, 31009, 31011, 31018, 31715–31811, and 35077–35105, KPM-NR 43909–43911, and NSMT-P 90703–90723, 91185–91208, 91638–91652, 92194–92195, 96055–96061, 96828–96833, 96836–96860, 96890–96902, 97045, 97084, and 97109–97111.

The information of these vouchers has been submitted to the Global Information Facility (<http://www.gbif.org/>) via the museums.

Checklist of the fishes of the Kubo, Tochikura, and Ichinono River Basins

Lethenteron reissneri (Dybowski, 1869)

Materials

- a. scientificName: *Lethenteron reissneri*; country: Japan; stateProvince: Iwate; locality: Ichinono River; verbatimLatitude: 38°54'19"N; verbatimLongitude: 141°02'41"E; year: 2008; month: 5; day: 3; individualCount: 1; catalogNumber: KPM-NI 21186; recordedBy: Shin-ichi Suda; identifiedBy: Yusuke Miyazaki; dateIdentified: 2008; basisOfRecord: PreservedSpecimen
- b. scientificName: *Lethenteron reissneri*; country: Japan; stateProvince: Iwate; locality: Tochikura River; verbatimLatitude: 38°54'43.05"N; verbatimLongitude: 141°01'24.39"E; year: 2008; month: 5; day: 2; individualCount: 1; catalogNumber: KPM-NI 21195; recordedBy: Hiroshi Senou; identifiedBy: Hiroshi Senou; dateIdentified: 2008; basisOfRecord: PreservedSpecimen
- c. scientificName: *Lethenteron reissneri*; country: Japan; stateProvince: Iwate; locality: Kubo River; verbatimLatitude: 38°55'38"N; verbatimLongitude: 140°56'57"E; year: 2009; month:

Conservation status: National: VU (Ministry of the Environment, Japan 2013); Prefectural: NT (Iwate Prefecture 2014).

Distribution: Arctic and Pacific Ocean drainage.

Notes: This taxon is morphologically identical to *L.* sp. N and *L.* sp. S of Yamazaki et al. (2006). These two putative species of *Lethenteron* are recognized only by a molecular analysis (Yamazaki et al. 2006), so we treated them as one species complex here because of the difficulty in differentiating the species on morphological characters alone (see Nakabo and Kai 2013 and its citations). Adults were observed in lotic environments, while larvae were observed in lentic environments such as in the silty/sandy bottom of floodplains.

Cyprinus rubrofuscus Lacepède, 1803

Materials

- a. scientificName: *Cyprinus rubrofuscus*; country: Japan; stateProvince: Iwate; locality: irrigation pond of the Kubo River Basin; verbatimLatitude: 38°55'17.3"N; verbatimLongitude: 140°59'26.7"E; year: 2008; month: 8; day: 27; individualCount: 1; catalogNumber: KPM-NI 22277; recordedBy: Yusuke Miyazaki; identifiedBy: Yusuke Miyazaki; datelidentified: 2008; basisOfRecord: PreservedSpecimen
- b. scientificName: *Cyprinus rubrofuscus*; country: Japan; stateProvince: Iwate; locality: irrigation pond of the Kubo River Basin; verbatimLatitude: 38°56'20.3"N; verbatimLongitude: 140°59'18.8"E; year: 2008; month: 8; day: 29; individualCount: 1; catalogNumber: KPM-NI 22278; recordedBy: Yusuke Miyazaki; identifiedBy: Yusuke Miyazaki; datelidentified: 2008; basisOfRecord: PreservedSpecimen

- c. scientificName: *Cyprinus rubrofuscus*; country: Japan; stateProvince: Iwate; locality: Tochikura River; year: 2008; month: 10; day: 9; individualCount: 1; catalogNumber: NSMT-P 96829; recordedBy: Yusuke Miyazaki and Yoko Takata; identifiedBy: Mikumi Takada; datelidentified: 2010; basisOfRecord: PreservedSpecimen
- d. scientificName: *Cyprinus rubrofuscus*; country: Japan; stateProvince: Iwate; locality: irrigation pond of the Kubo River Basin; year: 2008; month: 10; day: 10; individualCount: 5; catalogNumber: NSMT-P 96836; recordedBy: Yusuke Miyazaki; identifiedBy: Yoko Takata; datelidentified: 2010; basisOfRecord: PreservedSpecimen
- e. scientificName: *Cyprinus rubrofuscus*; country: Japan; stateProvince: Iwate; locality: irrigation pond of the Ichinono River Basin; year: 2008; month: 10; day: 9; individualCount: 1; catalogNumber: NSMT-P 96850; recordedBy: Kazuo Satou; identifiedBy: Kaoru Kuriwa; datelidentified: 2010; basisOfRecord: PreservedSpecimen

Native status: Non-native (100 of the World's Worst Invasive Alien Species: Lowe et al. 2000, Matsuzawa and Senou 2008). Native Japanese populations of the species have been widely affected by introgression due to human introductions, except for the population of north Lake Biwa (Mabuchi et al. 2005, Mabuchi et al. 2006, Mabuchi et al. 2008, Mabuchi et al. 2010), so therefore we regarded the carp populations of the region as non-native species.

Distribution: Laos, Vietnam, and China (Amur to Red River drainages).

Notes: This taxon is identical with *Cyprinus carpio* of Hosoya (2013). This species was observed almost always from lentic environments, but occasionally from lotic environments.

***Carassius cuvieri* Temminck & Schlegel, 1846**

Material

- a. scientificName: *Carassius cuvieri*; country: Japan; stateProvince: Iwate; locality: irrigation pond of the Kubo River Basin; verbatimLatitude: 38°55'49"N; verbatimLongitude: 141°01'33"E; year: 2010; month: 9; day: 5; individualCount: 1; catalogNumber: KPM-NI 30997; recordedBy: Yusuke Miyazaki; identifiedBy: Yusuke Miyazaki; datelidentified: 2010; basisOfRecord: PreservedSpecimen

Native status: Non-native (domestic non-native Species in Iwate Prefecture: Matsuzawa and Senou 2008). Native Japanese populations of the species have been widely affected by introgression due to human introductions except for the population of north Lake Biwa (Mabuchi et al. 2005, Mabuchi et al. 2006, Mabuchi et al. 2008, Mabuchi et al. 2010), so therefore we regarded the populations of the region as non-native species.

Distribution: Endemic to Lake Biwa, Japan.

Notes: This species was captured an irrigation pond with dense aquatic plants.

Carassius auratus* subsp. *buergeri* (Temminck & Schlegel, 1846)*Materials**

- a. scientificName: *Carassius auratus buergeri*; country: Japan; stateProvince: Iwate; locality: irrigation pond of the Ichinono River Basin; verbatimLatitude: 38°53'43"N; verbatimLongitude: 140°58'49"E; year: 2008; month: 5; day: 5; individualCount: 1; catalogNumber: KPM-NI 21196; recordedBy: Yusuke Miyazaki; identifiedBy: Yusuke Miyazaki; datelidentified: 2013; basisOfRecord: PreservedSpecimen

Conservation status: National: VU (Ministry of the Environment, Japan 2013); Prefectural: NT (Iwate Prefecture 2014).

Distribution: Japan

Notes: This taxon is identical to *Carassius buergeri* subsp. 2 of Hosoya (2013). Hosoya (2002) treated this species as a subspecies of *C. auratus* based on genetics, ecological features and comparison with the types in RMNH (but this work is still under preparation). This taxon was mostly collected from lentic environments, but occasionally from lotic environments.

Rhodeus ocellatus subsp. *ocellatus* (Kner, 1866)

Materials

- a. scientificName: *Rhodeus ocellatus ocellatus*; country: Japan; stateProvince: Iwate; locality: Kubo River; verbatimLatitude: 38°54'55.4"N; verbatimLongitude: 141°04'23.7"E; year: 2008; month: 7; day: 8; individualCount: 1; catalogNumber: KPM-NI 22258; recordedBy: Yusuke Miyazaki; identifiedBy: Yusuke Miyazaki; dateIdentified: 2008; basisOfRecord: PreservedSpecimen
- b. scientificName: *Rhodeus ocellatus ocellatus*; country: Japan; stateProvince: Iwate; verbatimLatitude: 38°55'14"N; verbatimLongitude: 141°01'13"E; year: 2009; month: 5; day: 19; individualCount: 1; catalogNumber: KPM-NI 23982; recordedBy: Yusuke

- Miyazaki; identifiedBy: Yusuke Miyazaki; dateIdentified: 2009; basisOfRecord: PreservedSpecimen
- c. scientificName: *Rhodeus ocellatus ocellatus*; country: Japan; stateProvince: Iwate; locality: irrigation pond of the Kubo River Basin; verbatimLatitude: 38°55'14"N; verbatimLongitude: 141°01'13"E; year: 2009; month: 5; day: 19; individualCount: 1; catalogNumber: KPM-NI 23983; recordedBy: Yusuke Miyazaki; dateIdentified: 2009; basisOfRecord: PreservedSpecimen
 - d. scientificName: *Rhodeus ocellatus ocellatus*; country: Japan; stateProvince: Iwate; locality: Kubo River; year: 2008; month: 10; day: 10; individualCount: 1; catalogNumber: NSMT-P 96898; recordedBy: Yusuke Miyazaki and Yoko Takata; identifiedBy: Yoko Takata; dateIdentified: 2010; basisOfRecord: PreservedSpecimen

Native status: Non-native (100 of the Japanese Worst Invasive Alien Species: Murakami and Washitani 2002).

Distribution: China and Korea.

***Zacco platypus* (Temminck & Schlegel, 1846)**

Materials

- a. scientificName: *Zacco platypus*; country: Japan; stateProvince: Iwate; locality: Tochikura River; verbatimLatitude: 38°54'29.3"N; verbatimLongitude: 141°02'52.8"E; year: 2008; month: 7; day: 9; individualCount: 1; catalogNumber: KPM-NI 22257; recordedBy: Yusuke Miyazaki; identifiedBy: Yusuke Miyazaki; dateIdentified: 2008; basisOfRecord: PreservedSpecimen
- b. scientificName: *Zacco platypus*; country: Japan; stateProvince: Iwate; locality: Kubo River; verbatimLatitude: 38°54'55"N; verbatimLongitude: 141°04'24"E; year: 2009; month: 5; day: 2; individualCount: 1; catalogNumber: KPM-NI 23994; recordedBy: Yusuke Miyazaki; identifiedBy: Yusuke Miyazaki; dateIdentified: 2009; basisOfRecord: PreservedSpecimen
- c. scientificName: *Zacco platypus*; country: Japan; stateProvince: Iwate; locality: Kubo River; verbatimLatitude: 38°54'55"N; verbatimLongitude: 141°04'24"E; year: 2009; month: 5; day: 2; individualCount: 1; catalogNumber: KPM-NI 23995; recordedBy: Yusuke Miyazaki; identifiedBy: Yusuke Miyazaki; dateIdentified: 2009; basisOfRecord: PreservedSpecimen
- d. scientificName: *Zacco platypus*; country: Japan; stateProvince: Iwate; locality: Ichinono River; year: 2008; month: 7; day: 6; individualCount: 1; catalogNumber: NSMT-P 91200; recordedBy: Yusuke Miyazaki; identifiedBy: Yusuke Miyazaki; dateIdentified: 2008; basisOfRecord: PreservedSpecimen
- e. scientificName: *Zacco platypus*; country: Japan; stateProvince: Iwate; locality: Tochikura River; year: 2008; month: 7; day: 11; individualCount: 4; catalogNumber: NSMT-P 91647; recordedBy: Yusuke Miyazaki; identifiedBy: Yusuke Miyazaki; dateIdentified: 2008; basisOfRecord: PreservedSpecimen
- f. scientificName: *Zacco platypus*; country: Japan; stateProvince: Iwate; locality: Tochikura River; year: 2008; month: 10; day: 9; individualCount: 1; catalogNumber: NSMT-P 96830; recordedBy: Yusuke Miyazaki and Yoko Takata; identifiedBy: Takashi P. Satoh; dateIdentified: 2010; basisOfRecord: PreservedSpecimen
- g. scientificName: *Zacco platypus*; country: Japan; stateProvince: Iwate; locality: Ichinono River; year: 2008; month: 10; day: 9; individualCount: 1; catalogNumber: NSMT-P 96847;

recordedBy: Yusuke Miyazaki and Yoko Takata; identifiedBy: Takashi P. Satoh; dateIdentified: 2010; basisOfRecord: PreservedSpecimen

Native status: Non-native (domestic non-native species in Iwate Prefecture: Matsuzawa and Senou 2008).

Distribution: Far East Asia.

Notes: This taxon is referred to as *Opsariichthys platypus* by Hosoya (2013). This species was only captured from lotic waters of the rivers in the present study.

***Rhynchocypris steindachneri* (Sauvage, 1883)**

Materials

Distribution: Japan

Notes: We do not follow the Catalog of Fishes, but follow Kottelat (2006) in the nomenclature of this species. This taxon is identical with *Phoxinus lagowskii steindachneri* of Hosoya (2013), and was recorded from lotic waters and the inlets to some lentic waters.

Tribolodon hakonensis (Günther, 1880)

Materials

Native status: Non-native (domestic non-native species in Iwate Prefecture: Matsuzawa and Senou 2008).

Distribution: Far East Asia

Notes: This species was captured only from lentic environments, and was often found together with *Cyprinus rubrofuscus*.

Pseudorasbora pumila Miyadi, 1930

Conservation status: National: CR (Ministry of the Environment, Japan 2013); Prefectural: CR+EN (Iwate Prefecture 2014).

Distribution: Japan.

Notes: This taxon is identical to *Pseudorasbora pumila pumila* of Hosoya (2013), in light of a potential new subspecies of *Pseudorasbora pumila* being recognized from Nagano, Shizuoka, Aichi, and Gifu Prefectures (Hosoya 2002, Hosoya 2013). This taxon was only recorded in irrigation ponds rich in aquatic plants.

***Pseudogobio esocinus* subsp. *esocinus* (Temminck & Schlegel, 1846)**

Materials

- a. scientificName: *Pseudogobio esocinus esocinus*; country: Japan; stateProvince: Iwate; locality: Ichinono River; verbatimLatitude: 38°54'17.9"N; verbatimLongitude: 141°02'42.1"E; year: 2008; month: 7; day: 8; individualCount: 1; catalogNumber: KPM-NI 22252; recordedBy: Yusuke Miyazaki; identifiedBy: Yusuke Miyazaki; dateIdentified: 2008; basisOfRecord: PreservedSpecimen

Conservation status: National: VU (Ministry of the Environment, Japan 2013).

Distribution: Japan.

Notes: This species usually inhabits lotic environments of river (Kawanabe et al. 2001, Hosoya 2013). However, Sugiyama (1997) mentioned that this species often inhabits isolated ponds in the mountains in Tohoku region. Our records of this species also include the isolated irrigation ponds as well as the rivers.

Oncorhynchus keta (Walbaum, 1792)

Materials

- a. scientificName: *Oncorhynchus keta*; country: Japan; stateProvince: Iwate; locality: Ichinono River; verbatimLatitude: 38°54'19"N; verbatimLongitude: 141°02'41"E; year: 2008; month: 5; day: 3; individualCount: 1; catalogNumber: KPM-NI 21183; recordedBy: Yusuke Miyazaki; identifiedBy: Yusuke Miyazaki; datelidentified: 2008; basisOfRecord: PreservedSpecimen

Native status: Non-native (See Discussion)

Conservation status: National: VU (Ministry of the Environment, Japan 2013); Prefectural: VU (Iwate Prefecture 2014).

Distribution: Japan.

Notes: The species was recorded only from irrigation ponds with rich aquatic plants in the study.

***Micropterus salmoides* (Lacepède, 1802)**

Native status: Non-native (100 of the World's and Japanese Worst Invasive Alien Species: Lowe et al. 2000, Murakami and Washitani 2002).

Distribution: North America.

Notes: This non-native invasive species was recorded only from irrigation ponds on our surveys.

Cottus nozawae Snyder, 1911

Materials

- d. scientificName: *Cottus nozawae*; country: Japan; stateProvince: Iwate; locality: Kubo River; year: 2009; month: 9; day: 23; individualCount: 1; catalogNumber: KPM-NI 24411; recordedBy: Yusuke Miyazaki, Shogo Nishihara and Taichi Okeda; identifiedBy: Hiroshi Senou; datelidentified: 2009; basisOfRecord: PreservedSpecimen

Conservation status: National: LP (Ministry of the Environment, Japan 2013); Prefectural: VU (Iwate Prefecture 2014).

Distribution: Japan.

Notes: This species usually inhabits fast lotic waters (Kawanabe et al. 2001), but, our collections of this species were from slow-moving back waters of the upper reaches of the Kubo River.

Rhinogobius brunneus (Temminck & Schlegel, 1845)

Distribution: Japan, Taiwan, Korea, China, Philippines, and Vietnam.

Notes: Japanese researchers have considered that the *Rhinogobius brunneus* complex currently includes many valid, synonymous species, and potentially several undescribed species (Akihito et al. 2002, Akihito et al. 2013). This taxon of this region matches the "*Rhinogobius* sp. OR of Akihito et al. (2002)" species complex (see Akihito et al. 2002, Akihito et al. 2013). It was recorded only from lentic waters including irrigation ponds, channels, and slow moving parts of rivers in the present study.

Analysis

Following the literature review, 35 freshwater fish taxa, including subspecies, belonging to 12 families in eight orders were considered to occur naturally in Iwate Prefecture (Table 1). Of these, 24 species/subspecies were determined to constitute the potential species pool of the survey area following our literature review (Table 1).

Table 1.

List of fishes occurring naturally in Iwate Prefecture, northern Japan. From this list the potential species pool was determined by the literature review (ref. Kawanabe et al. 2001, Ozawa et al. 2003, Matsuzawa and Senou 2008, Kumagai and Katsushima 2012, Nakabo 2013). CR, critically endangered; EN, endangered; VU, vulnerable; NT, near threatened; DD, data deficient; LC, least concern; LP, threatened local population; category of red lists (Ministry of the Environment, Japan 2013, Iwate Prefecture 2014). YES, NO; ¹Listed as non-native species (Matsuzawa and Senou 2008, Nakabo 2013); ²Record from each study region based on the field surveys.

Twenty freshwater fish species/subspecies belonging to 9 families in 6 orders were recorded during field surveys (Figs 3, 4, 5, 6, 7; Table 1); 12 species/subspecies belong to Cypriniformes (62% of the total), 3 to Perciformes (14%), 2 to Salmoniformes (10%), and 1 each to Petromyzontiformes, Siluriformes, and Beloniformes (5% each). At the family level, Cyprinidae had the highest number of representatives (11, 52% of the total), followed by Cobitidae and Salmonidae (2, 10% each). Petromyzontidae, Bagridae, Adrianichthyidae, Cottidae, and Gobiidae were represented by one species each (5%). Three species/subspecies, *Zacco platypus*, *Pseudogobio esocinus esocinus*, and *Oncorhynchus keta*,

were not recorded upstream of the dams constructed in the lower reaches of the Kubo and Tochikura Rivers.

d: *Rhinogobius brunneus*, KPM-NI 21193, 37.9 mm SL (female).

Among the 20 species collected in the field were nine national/prefectural red list species (*Lethenteron reissneri*, *Carassius auratus buergeri*, *Pseudorasbora pumila*, *Pseudogobio esocinus*, *esocinus*, *Misgurnus anguillicaudatus*, *Tachysurus tokiensis*, *Oncorhynchus masou*, *masou*, *Oryzias latipes*, and *Cottus nozawae*: Iwate Prefecture 2014; Ministry of the Environment, Japan 2013), three naturalized non-native species (*Carassius cuvieri*, *Zacco platypus*, and *Pseudorasbora parva*: Matsuzawa and Senou 2008], and three non-native invasive species (*Cyprinus rubrofuscus*, *Rhodeus ocellatus*, and *Micropterus salmoides*: Lowe et al. 2000, Murakami and Washitani 2002) (Table 1).

The rarefaction curves of survey data from irrigation ponds and rivers are shown in Fig. 8; the expected saturation point of species richness was reached.

Discussion

Only 13 of the 24 species/subspecies from our estimated potential species pool were collected during field surveys, including nine national/prefectural red list species (Table 1). In addition, seven non-native species, including one national/prefectural red list species and three non-native invasive species, were recorded (Table 1).

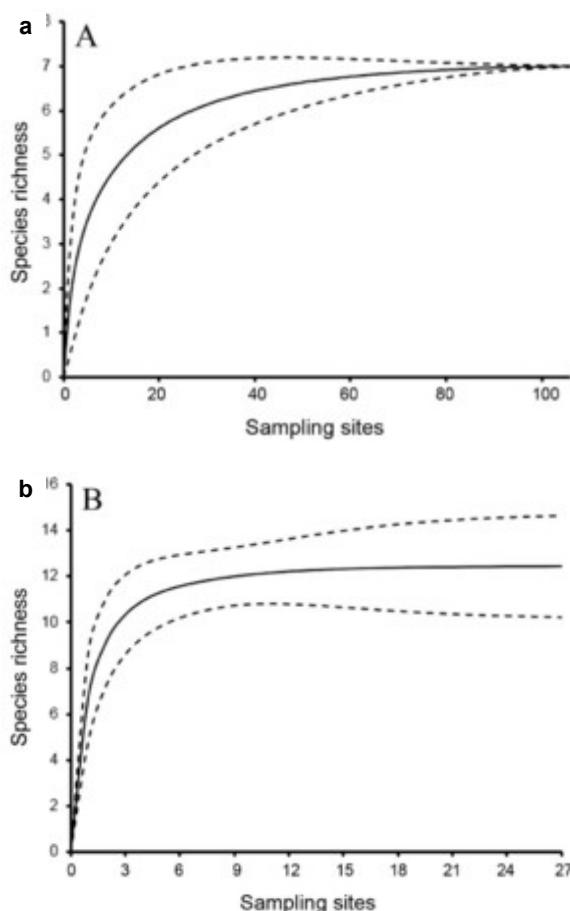

Figure 8.

Rarefaction curves analyzed using presence/absence data of native fish species. The solid line indicates the mean value, while the dashed lines indicate the 95% CI upper and lower limits.

a: at the irrigation ponds

b: at the rivers

Ten species/subspecies of the potential species pool for the survey area were not recorded during field surveys (Table 1). Of these, *Lethenteron camtschaticum* (Tilesius, 1811), *Anguilla japonica* Temminck & Schlegel, 1847, *Tribolodon brandtii* (Dybowski, 1872), *Plecoglossus altivelis altivelis* (Temminck & Schlegel, 1846), *Salvelinus leucomaenis* subspp., and *Rhinogobius nagoyae* Jordan & Seale, 1906 were most likely missed due to the limited number of sampling points in the rivers. The remaining uncaptured species/subspecies in the potential species pool (i.e., *Tribolodon ezoae* Okada & Ikeda, 1937, *Lefua echigonia* Jordan & Richardson, 1907, and *Cottus pollux* Günter, 1873) were considered to have a low probability of occurrence in the study region due to a limited distribution in

Tohoku region (they depend on sea currents for their migration and/or were near the boundaries of their distributional ranges) (Kawanabe et al. 2001, Ozawa et al. 2003, Nakabo 2013). It is also possible that our predicted species pool for the survey region was inaccurately estimated due to a lack of data regarding biological interactions, heterogeneity of environments, and quality/quantity of the various habitats. In other words, some species included in the potential species pool might well have been excluded if we had more data on their ecology, particularly with respect to their biological interactions with other fishes. There is also the chance of local extirpation.

The possibility that insufficient sampling efforts influenced the results of the present study is supported by the rarefaction curve as described below. The curve analyzed by using the presence/absence data of the irrigation ponds suggests that no more native species will be recorded from the ponds of the region due to the curve reaching saturation (Fig. 8a). However, the rarefaction curve of the rivers suggests that 1–3 additional native species could be recorded based on the curve's saturation point and its 95% CI upper bound (Fig. 8b). It is also important to state that the species richness estimates assume that our survey techniques have an equal probability of capturing every species, but this assumption is likely to be violated in practice due to the different characteristics of each species (i.e. small benthic species or large active species maybe harder to catch).

The Kubo and Tochikura Rivers are both dammed, and *Zacco platypus*, *Pseudogobio esocinus esocinus*, and *Oncorhynchus keta* were not recorded upstream of the dams. This suggests that the dams have negatively affected migratory behavior in these species (although *Z. platypus* is a naturalized non-native species).

The meta-population of *Oryzias latipes* in the study region was possibly introduced by local residents. The altitude at which it was recorded (105–160 m) is perhaps too high to consider this a natural occurrence. Populations of *O. latipes* in Kanagawa Prefecture naturally occur at a height of ~30 m above sea level (Senou unpublished), for example. Additionally, the specimens collected did not exhibit breeding condition, except at one sampling site (Miyazaki 2010). According to the local residents, these non-breeding populations probably all originated from the same source near the river system. This species is highly threatened and locally extirpated in many parts of Iwate Prefecture, including elsewhere in the river system studied here, and more generally in Japan (Ministry of the Environment, Japan 2013, Iwate Prefecture 2014). Therefore, we regard these populations of *O. latipes* as a target for ex-situ conservation because of the high vulnerability of the original populations and the less damaging ecological effects in the study region.

Although we tentatively identified all specimens of the genus *Carassius*, except for *C. cuvieri*, as *C. auratus buergeri*, the specimens display some morphological variability. One specimen (KPM-NI 23745: Fig. 3e) has 16 soft, branched dorsal-fin rays (vs. 12–14 in *C. a. b.*), and the other specimens have an angular jugular (lower jaw). Within Japanese crucian carps, the angular jugular is one of the specific characters of *Carassius auratus grandoculis* Temminck & Schlegel, 1846 (Hosoya 2013), whereas Takahashi (2003) reported that *C. a. b.* populations from irrigation ponds of Ehime Prefecture tend to have an

angular jugular. Further information on the morphology, molecular biology, and biogeography of Japanese crucian carps is urgently needed, because they include national and regional red list species and/or populations (Ministry of the Environment, Japan 2013; Iwate Prefecture 2014). In fact, Dr. Nakamura, who published the current taxonomy of Japanese crucian carps (Nakamura 1969), indicated that morphological variations and distributional ranges of *C. a. b.* in northern Japan are in need of clarification (Nakamura 1969, Nakamura 1976).

Among the red list species recorded in the present study, *Lethenteron reissneri*, *Pseudorasbora pumila*, *Tachysurus tokiensis*, *Oryzias latipes*, and *Cottus nozawae* (threatened species) were rare and are considered vulnerable. Further research of these species is required, particularly with regard to their population dynamics and conservation in the Kubo-gawa Ihatov area. Similarly, the population dynamics and extended distributions of the non-native and invasive species should be studied in greater detail with a special focus on potential methods of removal. In particular: *Cyprinus rubrofuscus*, which has been reported as having highly negative effects on native macrophytes and odonates in the region (Miyazaki et al. 2010, Sekizaki et al. 2012, Yoshioka et al. 2014); *Pseudorasbora parva*, which has replaced *P. pumila* following hybridization in many localities (Konishi and Takata 2004, Konishi 2010); and *Micropterus salmoides*, which has apparently been illegally introduced by sport fishermen and/or residents (Miyazaki 2010, Tsunoda et al. 2011).

We refer the above suggestions to the focal nature restoration committee (see also Chisaka 2010). In other words, the localities of vulnerable species (i.e., *Lethenteron reissneri*, *Carassius auratus buergeri*, *Pseudorasbora pumila*, *Tachysurus tokiensis*, *Oryzias latipes*, and *Cottus nozawae*) will be preferentially conserved and that of non-native species that negatively affect sustainability of native species (i.e., *Cyprinus rubrofuscus*, *Pseudorasbora parva* and *Micropterus salmoides*) will be preferentially removed. In addition, we will further investigate suitable habitats in the target area to record the remaining uncaptured species/subspecies from the potential species pool. Therefore, the comparison of the potential species pool with the national and regional Red Lists provides useful suggestions for priority species that should be conserved or removed, and for determining further sampling sites with suitable habitat for the absent species (those listed in the potential species pool that were not yet collected in the field surveys).

The determination of the freshwater fish species pool of a given region is an essential first step in restoration ecology (Fattorini and Halle 2004, Hobbs and Norton 2004, Funk et al. 2008). When followed up with field surveys, desk surveys can lead to an improved understanding of regional biotas and their primary characteristics, permit prediction of potential extinction events caused by natural or anthropogenic factors, and provide insights regarding the geological history affecting freshwater fish distributions. Furthermore, many restoration projects are somewhat restricted by budgets, human resources, and/or methodology (e.g., Joseph et al. 2009, Carwardine et al. 2012), however, desk surveys are required as an important first step to determine the potential species pool. However, this information can be limited, as shown here, and precise information from field surveys can

then feed back into improved estimates for future desk surveys and restoration ecology projects.

Acknowledgements

We are especially grateful to G. Chisaka, R. Sato (Nature Restoration Research Institute of Kubo-kawa Ihatov), Y. Sekizaki (InterRisk Research Institute & Consulting, Inc.), H. Takeda (The University of Tsukuba), S. Deguchi, S. Nishihara, T. Okeda, S. Suda, I. Washitani (The University of Tokyo), T. Kadoya (National Institute for Environmental Studies) and Y. Takata (Osaka Museum of Natural History) for assistance with the field surveys. We also thank R. Takahashi and other volunteer staff (KPM), K. Kuriwa (The University of Ryukyus), T. P. Satoh, G. Shinohara, and K. Matsuura (NSMT) for specimen registrations and some identifications. A special thanks to G. Yearsley (Hobart, Tasmania), R. Collins, M. Ford, and an anonymous reviewer for commenting on the manuscript. This study was partly supported by Grants-in-Aids from Ministry of Education, Culture, Sports, Science and Technology, Japan [no. 22310143 (to H. Senou), and no. 25·11038 (to Y. Miyazaki, JSPS Research Fellow)].
