Abstract

Background

Limoniidae is one of the most species-rich Dipteran families, with 661 reported species in Europe. Despite the fact that the European limoniid crane fly fauna has been studied ever since Carolus Linnaeus, it is still poorly known.

New information

In this study, we summarise the taxonomic and faunistic studies of European Limoniidae, which described new species and reported first country records, between 2010 and 2020. We also report occurrence data of 244 Limoniidae species which represent the first country records or conformational records from various European countries, as we report ten species from Albania, one from Austria, thirty-seven from Belarus, five from Belgium, two from Bulgaria, two from Estonia, six from Finland, seven from France, fourteen from Greece, sixteen from Hungary, two from Iceland, six from Italy, ten from Latvia, one from Malta, nine from Montenegro, two from The Netherlands, ten from North Macedonia, forty-two from Norway, one from Poland, five from Portugal, twenty from Romania, thirty-eight from Serbia, six from Slovenia, five from Spain and seven species from Sweden for the first time. From the European territory of Russia, we report twenty-eight species from Central European Russia, seventy-two from East European Russia, fifteen from North European Russia, one from Northwest European Russia and seven from North Caucasus for the first time. Confirmatory records and corrigenda are also included.

Introduction

Crane flies (superfamily Tipuloidea) are one of the most species-rich dipteran groups, with more than 15600 recognised taxa (Oosterbroek 2021). Using currently accepted systematics, Tipuloidea is divided into four families: Cylindrotomidae, Limoniidae, Pediciidae and Tipulidae (Starý 1992, Starý 2021). The family Limoniidae, the so-called short-palped crane flies, is the most speciose dipteran family with more than 10700 valid species, which represents approximately 0.55% of the catalogued species of the world (Røskov et al. 2019, Oosterbroek 2021).

Since the description of the first limoniid crane fly species by C. Linnaeus in 1758, the number of described/reported species from Europe has continuously increased (Fig. 1). So far, 661 valid species and subspecies have been reported, according to Catalogue of the

Craneflies of the World (Oosterbroek 2021). A total number of 31 new limoniid species are described here from Europe between 2010 and 2020 (Table 1). Most of the new species are found in the Mediterranean area and belong to the species-rich genus *Molophilus* Curtis, 1833.

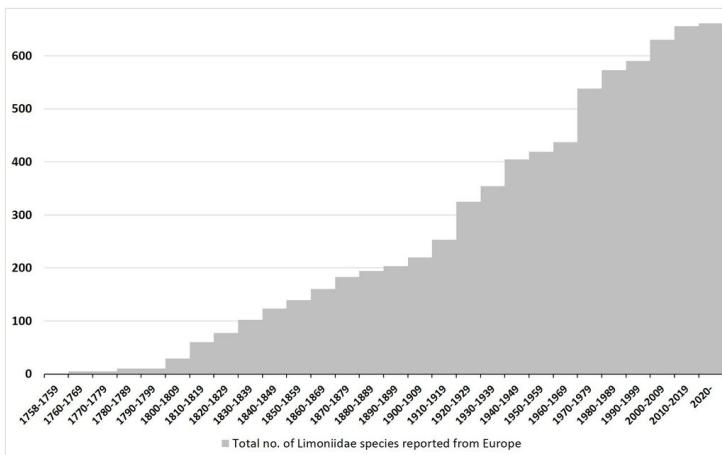

Figure 1. doi

Cumulative number of European Limoniidae species per decade.

In the last decade, many new faunistic studies have been published on European Limoniidae, of which we list the ones that report at least one species for the first time from a country (Table 2). Thanks to the increasing accessibility to publications, databases and community forums, more and more people have become interested in crane flies and provide useful information and specimens for faunistic and taxonomic studies. The Catalogue of the Craneflies of the World (CCW, available in <https://ccw.naturalis.nl/index.php>) is the indispensable online database for all kinds of research connected to

crane flies. The CCW includes information about the taxonomy, distribution, ecology and biology of species, based both on scientific publications and on personal information sent/forwarded to Pjotr Oosterbroek. Often these personal observations represent the first record(s) of a species from a country or territory, but they are never published in scientific publications.

The aim of this paper is to publish the first records of limoniid crane flies from various European countries. A collection of previously unpublished scientific records from CCW uploaded between 2010 and 2020 is also included, which represent the first country record(s) of the species in question. Confirmatory records and some corrigenda are also included. In total, we present 859 records belonging to 244 species.

Materials and methods

Geographic coverage

In this study, we focus on the territory of Europe (Fig. 2), following CCW geopolitical unit concepts, which are based upon the Fauna Europaea, but the North Caucasus is also included (de Jong et al. 2014, Oosterbroek 2021). The European territory of Russia is divided into North, Northwest, Central, East and South European Russia and North Caucasus. The lists of the territories (respublika, oblast, kray), included in these six subdivisions, are presented in Suppl. material 1, including the Russian names of subdivisions and territories.

Geopolitical units of Europe according to the CCW, with sampling localities presented in this study.

Sampling method and identification

Studied material has been collected by recognised manual field methods, such as sweep or hand-netting or trapped by the use of Malaise traps, SLAM-traps, light traps, trunk emergence traps, Lindgren funnel traps, pitfall traps, pan traps and window traps. Some records are based on photos or field observations. The preserved material is pinned or stored in ethanol and deposited in various public or private collections.

About 99% of the material is identified by the authors (excluding K. Watanabe) and the identifier(s) are responsible for the corresponding records. Collection data also available on the GBIF.org database (GBIF.org 2021).

Photographs of wing, body and terminalia of some rare species were taken by the first author, by using a Zeiss Stemi 508 stereomicroscope, equipped with a Canon Kiss M digital camera or with Optik microscope, equipped with a LM Digital SLR Adapter and Canon 650D camera.

First country record

Several species listed below have already been reported from different countries (geopolitical units) in the CCW, based on unpublished information and referred to as *in litt* in the CCW. Here, we publish the collection data for these records as well. If a record was credited to another person other than one of the authors of this paper, we highlight this, otherwise we simply refer to it as the first country record(s). General information and

distribution of each species is available on the CCW and can be accessed by the links provided below.

Distribution

First records from Russia: RUC. The species was considered doubtful for Norway, see discussion in Olsen et al. (2018), but has subsequently been verified. Here, we publish the collection data of those records. The older specimen was published by Siebke (1877) as *Erioptera obscuripes* (see Lackschewitz 1933), under which name it was stored in NHMO until November 2017. However, Lackschewitz (1936) seems to have sorted it out, but this has not been followed up in Norwegian literature and the museum.

Distribution

Presence of the species in Norway mentioned in Viitanen (2018) without further details; here, we publish the collection data of that record. Uncertain presence of the species in the United Kingdom (Scotland) mentioned in Kramer 2018; here, we confirm the identification of that specimen and the presence of the species in the United Kingdom.

Thaumastoptera (Thaumastoptera) calceata Mik, 1866

- CCW <https://ccw.naturalis.nl/detail.php?id=11327>

Material

- a. scientificName: *Thaumastoptera (Thaumastoptera) calceata* Mik, 1866; family: Limoniidae; genus: *Thaumastoptera*; subgenus: *Thaumastoptera*; specificEpithet: *calceata*; scientificNameAuthorship: Mik, 1866; country: Netherlands; stateProvince: Limburg; decimalLatitude: 51.21; decimalLongitude: 5.97; samplingProtocol: Reared; eventDate: 2012; verbatimEventDate: 2012; individualCount: 1; sex: female; occurrenceRemarks: 1 female; recordedBy: B. van Maanen; identifiedBy: P. Oosterbroek; basisOfRecord: HumanObservation; occurrenceID: EU_LIM_854

Distribution

The species was first reported from The Netherlands in the CCW by van Maanen (in litt. 2012). Here, we publish the collection data for that record.

Acknowledgements

The first author would like to thank Dr. Edina Török (Vácrátót, Hungary) for her enthusiastic help during the collection trips and thank Dr. Lujza Keresztes for allowing the use of facilities and equipment at Babes-Bolyai University (Cluj-Napoca, Romania). The authors are very grateful to collectors for providing valuable specimens and records, with which they contributed to the knowledge of the distribution of European Limoniidae. We also would like to thank Pasquale Ciliberti (NBCN, Leiden) for providing the collection data for some specimens deposited in the NBCN collection. We would like to thank Dr. Daichi Kato (Tokamachi, Japan) for reviewing the manuscript.

Funding Statement

L.-P. Kolcsár was supported by the Japan Society for the Promotion of Science (JSPS) Postdoctoral Fellowships for Research in Japan Short-term Program (Grant Number: PE18038) and Standard Program (Grant Number: P21094). This research was financially supported by the JSPS Grant-in-Aid for Scientific Research (Grant Numbers: 19K21996, 19H02276). The study of N.M. Paramonov was performed in the framework of the state research project AAAA-A17-117030310205-9 and the Presidium RAS program no.41 "Biodiversity of natural systems and biological sources of Russia". J. Mederos thanks the constant support offered by the MCNB curators Glòria Masó-Ros and Berta Caballero-López, as well as the Barcelona Zoo Foundation. The work of A. Polevoi was carried out under state order implemented by Karelian Research Centre RAS (Forest Research

Institute). The study of J. Starý was financially supported by the Ministry of Culture of the Czech Republic by institutional financing of long-term conceptual development of the research institution (the Silesian Museum, MK000100595). The work of V.I. Lantsov was carried out with the constant support of the Directorate of the Tembotov Institute of Ecology of Mountain Territories of Russian Academy of Sciences and the staff of the Dagestan State Nature Reserve, to whom he expresses his sincere gratitude, as well with the financial support from the Russian Fund of Fundamental Research (Grant No. 20-54-56030 Iran_t).

Data type: additional information

Brief description: Six main subdivisions of the European territory of Russia have been established, as North, Northwest, Central, East, South European Russia and North Caucasus. We list the territories (respublika, oblast, kray) included in these subdivisions, following the geopolitical boundaries of the Catalogue of the Craneflies of the World. We suggest a modification as Permskaya Oblast and Komi-Permyatskiy Avtonomnyy Okrug were merged in 2005 and it is now called Permskiy Kray. The Russian name of the subdivisions and territories are included.
